EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes
and/or additions be unacceptable to applicant, an amendment may be filed as provided
by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be
submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with George R. Rapacki on August 21, 2009.

2. The application has been amended as follows:

Claims 2-28, 49-66, 80-86, and 119-179 have been canceled.

- The following is an examiner's statement of reasons for allowance:
- 4. Claims 29-47 are allowable since the prior art of record does not teach or suggest in combination a first optical branch comprising a first optical delay element; a second optical branch comprising a main optical fiber having a forward direction of light propagation; a third optical branch, said third optical branch providing a Stokes beam to said second optical branch, said Stokes beam propagating in said main optical fiber in a direction opposite to said forward direction of light propagation; and a common path, said common path comprising: an optical portion having an optical modulator providing an optical signal to said first optical branch, said second optical branch, and said third

optical branch; and an electrical portion having at least one photodetector coupled to said first optical branch and said second optical branch, said at least one photodetector producing an electrical signal coupled to said optical modulator, in addition to other cited limitations

- 5. Claims 67-79 are allowable since the prior art of record does not teach or suggest in combination the step of generating a multi-tone optical comb comprises: modulating an optical signal from a laser with an optical modulator to provide a modulated optical signal; delaying said modulated optical signal in a first optical branch to provide a first delayed optical signal; propagating said modulated optical signal in a forward direction in a second optical branch to provide a second delayed optical signal; generating Stokes light from said modulated optical signal; injecting said Stokes light into said second optical branch so that said Stokes light propagates in a reverse direction to said modulated optical signal in said second optical branch, wherein said Stokes light acts as a seed for stimulated Brillouin scattering in said second optical branch; photodetecting said first delayed optical signal and said second delayed optical signal to produce an electrical signal; and controlling said optical modulator with said electrical signal, in addition to other cited limitations.
- 6. Claims 87-105 are allowed since the prior art of record does not teach or suggest in combination a multi-tone photonic oscillator comprising: a laser producing an optical carrier wave; a first optical branch comprising a first optical delay element; a second optical branch comprising a main optical fiber having a forward direction of light propagation; a third optical branch, said third optical branch providing a Stokes beam to

said second optical branch, said Stokes beam propagating in said main optical fiber in a direction opposite to said forward direction of light propagation; and a common path, said common path comprising: an optical portion having an optical modulator receiving said optical carrier wave and providing an optical signal to said first optical branch, said second optical branch, and said third optical branch; and, an electrical portion having at least one photodetector coupled to said first optical branch and said second optical branch, said at least one photodetector producing an electrical signal coupled to said optical modulator, in addition to other cited limitations.

7. Claims 106-118 are allowed since the prior art of record does not teach or suggest in combination a method of generating a multi-tone optical comb, the method comprising the steps of: modulating an optical signal from a laser with an optical modulator to provide a modulated optical signal; delaying said modulated optical signal in a first optical branch to provide a first delayed optical signal; propagating said modulated optical signal in a forward direction in a second optical branch to provide a second delayed optical signal; generating Stokes light from said modulated optical signal; injecting said Stokes light into said second optical branch so that said Stokes light propagates in a reverse direction to said modulated optical signal in said second optical branch, wherein said Stokes light acts as a seed for stimulated Brillouin scattering in said second optical branch; photodetecting said first delayed optical signal and said second delayed optical signal to produce an electrical signal; and controlling said optical modulator with said electrical signal, in addition to other cited limitations.
